Naming Standard

Rack Equipment Mounting Requirements

Equipment Mounting Requirements

Mount equipment in each network rack from top to bottom in the order shown below. Use the exact equipment names in the tables when labeling rack components, documenting connections, or referring to equipment in the training scenario. Keep the rack order consistent so the physical installation can be checked quickly against the naming standard.

First Floor Equipment

Order	Equipment Name	Mounting / Naming Notes
1	PDU1	Power distribution unit for the ground-floor rack.
2	Patch1	Patch panel for the ground-floor rack.
3	AN-1	Access switch for the ground-floor rack.
4	CN-1	Router for the ground-floor rack.
5	IT2	Server; retain the exact name IT2.

Rack: RACK01

Second Floor Equipment

Order	Equipment Name	Mounting / Naming Notes
1	PDU2	Power distribution unit for the second-floor rack.
2	Patch2	Patch panel for the second-floor rack.
3	AN-2	Access switch for the second-floor rack.

Rack: RACK02

Server and Previous Installation

IT2 is the server mounted in the ground-floor RACK01 installation. The server was installed previously; preserve its existing placement and established connections unless the scenario explicitly directs a change. When documenting or referring to it, use the exact name IT2.
